

On-brand, accessible output on every engagement, without adding a designer to each pod.

realfast delivers software with AI agents doing most of the building, and its reusable capability lives in installable skills. Engineering had dozens. Design had none. Over five months I built five.

Production software in weeks, with senior engineers and frontier models.

An AI-native software delivery firm: legacy modernisation, AI agent workflows, Salesforce implementations, and AI transformation engagements, on an in-house platform called Exo. Pods of two to five senior engineers, agents doing most of the building, outcomes tied to metrics agreed before work starts. Clients include Z47, AVPN, TASC, Houzbay, BoardRoom, and Hypernative.

~60%

BACKED BY

The founders built and sold one engineering firm, then ran product and technology at Gojek.

Sidu Ponnappa

CEO, Co-founder

Co-founded C42 Engineering, acquired by Gojek in 2015. Then CIO of Gojek Singapore, MD of Gojek India, and a Gojek Group board member.

Aakash Dharmadhikari

CPTO, Co-founder

Co-founded C42. Group Chief Product Officer and board member at Gojek. Later CPO at Jiva.

Steve Sule

CFO, Co-founder

Former Partner at Edith Grove Capital, previously Arma Partners and M&A at Mahindra & Mahindra. Joined as an advisor, became a co-founder.

Design was the one capability nobody could install.

WHAT ENGINEERING COULD INSTALL

discovery intake	requirements discovery	estimation
solution design	spec authoring	backlog authoring
delivery planning	client communication	backlog review
spec drift review	reconcile delivery	onboarding guides
salesforce coe	salesforce best practices	clickup
recruiting reviews	ecs debugging	agent builder

The first client demo

came out slightly off-brand because someone had eyeballed the hex codes.

Proposals and reports

looked different depending on who made them.

Blog posts

waited on a designer for a hero image.

Each one is small. In a services business, small costs that come back every week are where the margin goes.

WHAT DESIGN COULD INSTALL

Nothing, until April 2026.

My job was to build design production infrastructure for an engineering organisation. That meant putting design where the rest of the capability already lived, as skills the agents pick up, rather than as a person on each project.

One brand file, five skills, and every output an engagement produces.

Brand extraction writes the file. The theming skill applies it to interface code and `exo-designer` audits the result. The media studio reads a file of the same shape to render video. The house-style plugin is the same idea pointed at `realfast` itself, and illustration feeds imagery into documents and films alike. The design process wraps all of it in stages a client signs off on.

A client URL in, design tokens out, and the agent uses them without being asked.

/extract-brand

```
brand/theme.json · example values

{
  "name": "client",
  "colors": {
    "primary": { "hex": "#0B3D91", "role": "Primary actions, links" },
    "secondary": { "hex": "#F2A900", "role": "Highlights, badges" },
    "background": { "hex": "#FFFFFF" },
    "foreground": { "hex": "#111418" }
  },
  "typography": {
    "heading": { "family": "Sora" },
    "body": { "family": "Inter" }
  },
  "radius": { "sm": 4, "md": 8, "lg": 18 },
  "visualLanguage": { "buttons": "pill, filled", "cards": "bordered, flat" }
}

also written: brand/variables.css · brand/tailwind.theme.js
```

Fetch and screenshot

a headless browser captures desktop and mobile, so JavaScript-rendered pages come through

Pull the tokens

colours, fonts, spacing, and shadows from the stylesheets; Google Fonts checked for exact matches

Write three files

JSON, CSS variables, and a Tailwind theme, so any stack can consume it

Apply automatically

a companion skill wakes whenever the files exist; every component the agent writes uses them

Every proposal, report, and post leaves looking like realfast, and nobody opens a design tool.

```
claude · any repo

$ /plugin marketplace add ontic-in/grimoire
$ /plugin install realfast-design@grimoire
  realfast-design 1.0.0 installed · 19 templates, tokens, fonts

> use the realfast-design skill for this week's sprint report
  Reading readme.md and tokens/. Opening weekly-sprint-report.
  Filled masthead, RAG summary, three workstreams. Saved report.html
```

19 ready-to-fill templates, from proposal deck to social set

9 React primitives, from Button to PullQuote, all on 2 px corners

2 + 4 typefaces and brand colours, self-hosted so nothing drifts

36 house illustrations, with a muted set for the website

Open a template, replace the words and numbers, and the document is finished.

What comes next: usage numbers for every skill, one brand schema, and an evaluation gate for the films.

Pull installs and invocations per skill

The marketplace records installs and I have not pulled them. A case study about reusable capability should be able to say how often it is reused.

Unify the two brand schemas

So a client brand extracted from a URL flows into audits, documents, and video without translation.

Build the evaluation gate for media

The harness brief specified one. Until it exists, a person still watches every render before it ships.
